

Personal and Work-related Correlates of Mental Health  
in Slovak Women in Higher Education: 1996 and 2006

**Rosemary Krawczyk, Minnesota State University, Mankato**  
**Jon Kalinowski, Minnesota State University, Mankato**

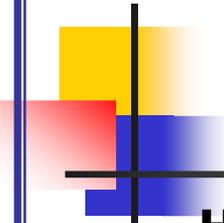

---

***E-Leader CASA***  
**Krakow, Poland, June 2008**

## Purpose of the Study

***To examine the association between mental health variables and specific work-related and personal factors.***

# Hypotheses

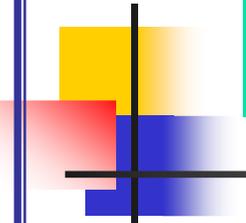

**H1: Role Conflict and Ambiguity will correlate positively with symptoms of depression, anxiety, hostility, and somatization.**

**H2: Greater externality will be associated with higher levels of somatization, anxiety, depression and hostility.**

**H3: The positive relationship between role conflict and ambiguity and psychological distress symptoms will be moderated by locus of control. High internality will buffer the negative impact of role conflict and ambiguity on mental health.**

**H4: Life satisfaction will correlate negatively with somatization, anxiety, depression, and hostility.**

**H5: Life Satisfaction will moderate the positive relationship between role conflict and ambiguity and symptoms of psychological distress. High life satisfaction will buffer the negative impact of role conflict and ambiguity on mental health.**

# Variables

## **Personal Variables**

Life Satisfaction

Internal vs. External Locus of Control

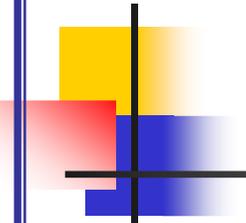

## **Work-related Variables**

Role Conflict

Role Ambiguity

## **Dependent Variables**

Mental Health (Psychological Distress Symptoms)

# Survey Instrument

## ***Women in Higher Education Questionnaire***

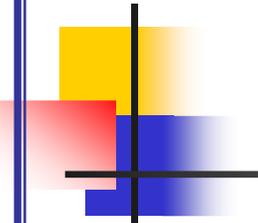

### Subscales:

- Symptom Checklist (SCL 90-R) (Payne, 1985)
- Rotter Internal-External Locus of Control (Rotter, 1966)
- Role Conflict and Ambiguity (Murphy et al., 1988)
- Life Satisfaction Index-A (Neugarten et al., 1961)

# Participants

SAMPLE 1 (1996)	N	Minimum	Maximum	Mean	STD Deviation
Age	55	22	64	37.76	11.63
Years Experience	54	1	41	13.79	10.26

SAMPLE 2 (2006)	N	Minimum	Maximum	Mean	STD Deviation
Age	35	27	65	46.57	11.47
Years Experience	36	1	44	19.01	12.40

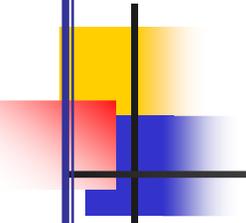

## Results-Table 2

### Zero-Order Correlations between Personal and Work Variables and Mental Health

	<u>Role Conflict</u>	<u>Role Ambiguity</u>	<u>Locus of Control</u>	<u>Life Satisfaction</u>
<b>Combined Symptom Scale</b>	<b>.347**</b>	<b>.252*</b>	<b>.375**</b>	<b>-.422**</b>
<b>Somatization</b>	<b>.292**</b>	<b>.243*</b>	<b>.310*</b>	<b>-.359**</b>
<b>Anxiety</b>	<b>.342**</b>	<b>.287**</b>	<b>.314*</b>	<b>-.368**</b>
<b>Depression</b>	<b>.259*</b>	<b>.292**</b>	<b>.434**</b>	<b>-.448**</b>
<b>Hostility</b>	<b>.331**</b>	<b>.252*</b>	<b>.123</b>	<b>-.242*</b>

---

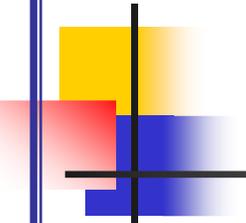

**\*p<.05, \*\*p<.01**

# Results

**H1:** Higher levels of role ambiguity and conflict were associated with higher levels of symptomatology across areas measured ( $p < .05$ ). **Supports H1.**

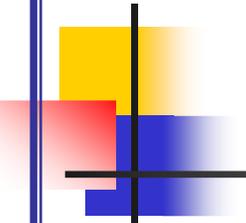

**H2:** Greater externality of locus of control was significantly related to higher combined symptom scores except for hostility ( $p < .05$ ). **Generally supports H2.**

# Results

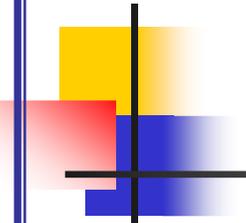

**H3:** High internality was not found to moderate the negative impact of role conflict and ambiguity on mental health. **(H3 was not supported)**

**H4:** Significant negative correlations were found between life satisfaction and combined symptom scores ( $p < .05$ ). **Supports H4.**

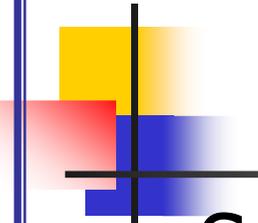

# Results

**H5:** High life satisfaction was not found to moderate the negative impact of role conflict and ambiguity on mental health. **(H3 was not supported)**

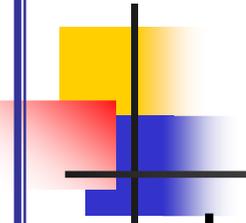

# Summary

- Work-related variables (role conflict and ambiguity) predict mental health in Slovak women in higher education as they did among U.S. women.
- Personal variables (locus of control and life satisfaction) predict mental health in Slovak women in higher education.
- Work-related variables were not moderated by locus of control or life satisfaction with respect to mental health among Slovak women in higher education.

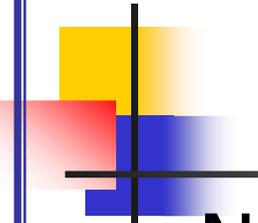

## Conclusions

- Some aspects of the experiences of women in higher education are similar across countries. Mental health appears to be affected by role conflict and ambiguity regardless of cultural context.
- Life Satisfaction is negatively associated with psychological distress symptoms and was lower for Slovak women than US women.

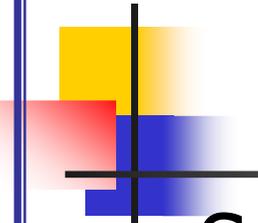

## Conclusions-Continued

- Level of externality for Slovak women was significantly higher than for US women and both were associated with symptoms of psychological distress.

# Limitations

- Non-matched samples
- Relatively small samples
- Possible Non-Response Bias
- Survey translation

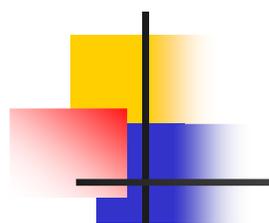

## Future Research

- Survey women in higher education in less-researched post-Communist western and eastern European countries.
- Survey women in higher education in a European country without a history of Communist rule.
- Survey a current sample of U.S. women in higher education.
